

## **Leibniz universitat Hannover**

While we were in Hannover, the professors chose three of our students to go to the university of physics.

From the Croatian group there was Luka, Luka and me. We woke up early and almost got lost on our way to the university because there were too many stations and streets. The first thing I saw when we got there was a beautiful building with a big horse in front of the entrance and the interior is filled with numerous decorations, rooms, older and newer. They took us to just one class because there were no pupils at that time. The lecture was led by Professor Mile Kovachev and he presented us something about physics. I think that the main topic were lasers and some small particles but I'm not sure because they were speaking English with a lot of words I couldn't understand since we don't have physics in our high school. After that when the class ended we went to experiment in mixed groups. In the end they took us to some laboratory where we looked machines for lasers. I searched the web site of university to find out that today there are more than 25,000 students in natural sciences and engineering, the humanities and social sciences as well as in law and economics.

After all, it was interesting and most importantly I learnt something completely new. The team was fun and the professors kept us awake. We also had lunch and we got to know the lifestyle of others.
